OPEN SOURCE:
FROM MYTHS TO POSSIBILITIES

What’s it for today?

- Open Source: Why, What, How
- History of Open Source
- Myth Busting
- Open Source in the real world
- Contributing & Benefits
- Monetization Possibilities
- Open Source AI
- Difficulties in Open Source

Open Source Technologies

Open source software (OSS) is source code developed and maintained through open collaboration. Anyone can use, examine, alter and redistribute OSS as they see fit, typically at no cost.

- Arduino (open-source electronics for prototyping).
- RISC-V (open-source CPU architecture, rivalling ARM).
- Wikipedia

But, Why?

- Transparency
- Cost Savings
- Community Collaboration
- Security
- Flexibility & Control
- Avoid Vendor Lock-In
- Better Learning

Ok, I get it.

So... Uhmm... How?

When did this start?

History of OSS

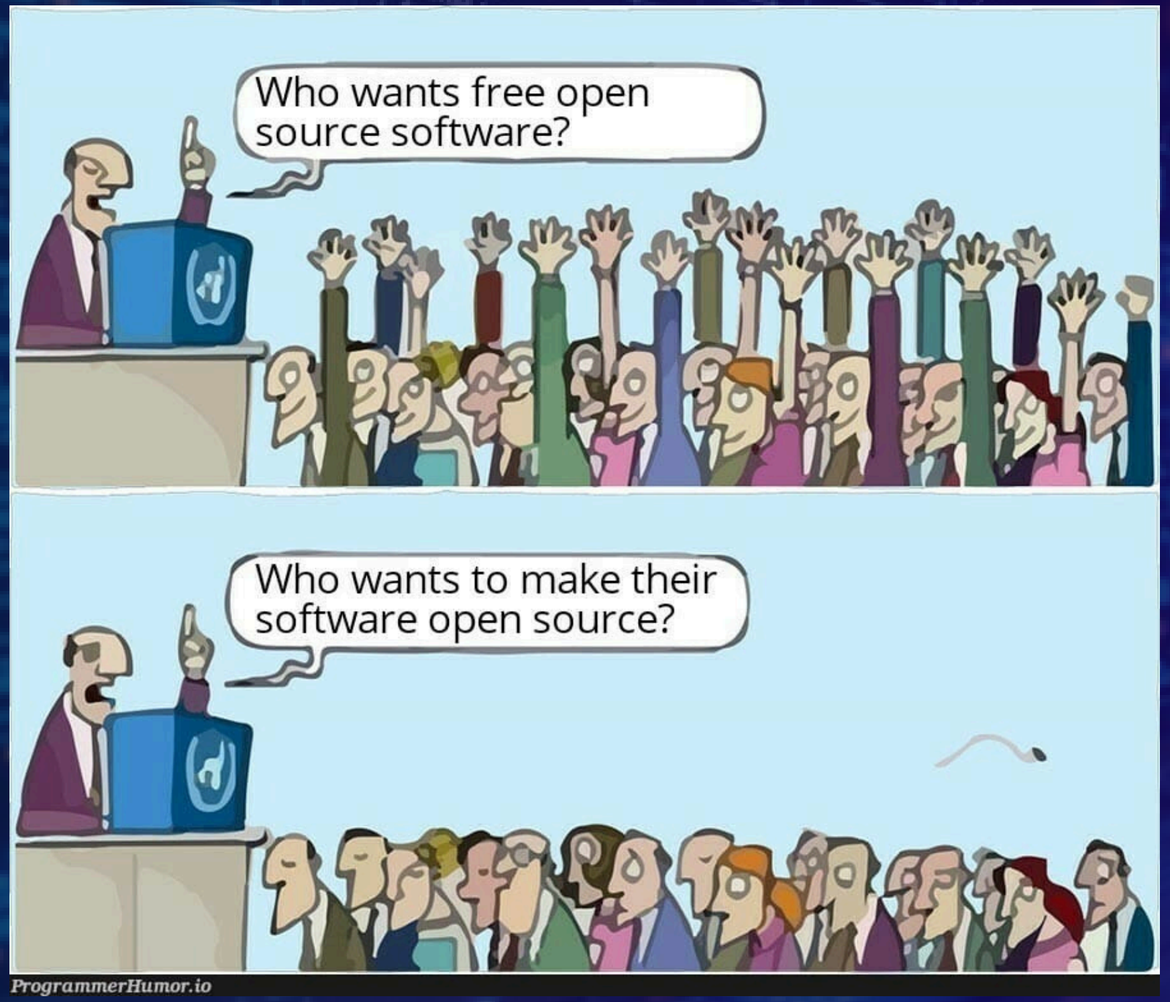

Organizations programmed their own software, and code sharing was a common practice.

The Commission on New Technological Uses of Copyrighted Works was established in 1974. It concluded that software code was a category of creative work suitable for copyright protection.

Stallman founded the Free Software Foundation

Eric S. Raymond's 1997 essay "The Cathedral and the Bazaar" is another watershed in the free software movement.

The term "open source" was adopted in 1999.

Who wants free open source software?
Who wants to make their software open source?
ProgrammerHumor.io

Oh, I thought...

Free softwares are open source
Open source is not secure
No monetization using OSS
Only Programmers Contribute

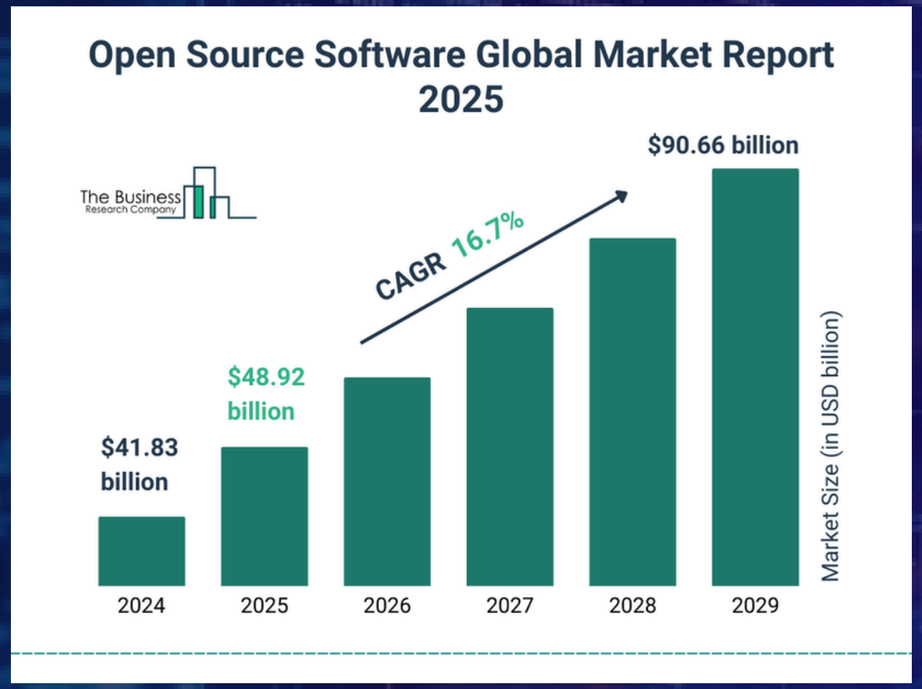

BUSTING OUT MYTHS!

Open Source in the Real World

- Web Development Open Source Projects
- Data Management
- Developer Tools
- Machine Learning and Big Data
- Containerization

“I power 100% of supercomputers, 80% of smartphones, Who am I?”

Open Source in the Real World

“I power 100% of supercomputers, 80% of smartphones, Who am I?”

Open Source Software Market 2025 - Market Scope And Share

Open Source Licenses

- MIT License
  - Eg: React JS
- GNU General Public License
  - Eg: Linux

MONETIZATION POSSIBILITIES

- Network integration
- End-user and IT support
- Services usually included with proprietary software.

MONETIZATION POSSIBILITIES

et's see a few examples and what are their monetization techniques:

IIEC-Redhat Linux → Acquired by IBM for $34B

- Free Linux → Paid enterprise support

MongoDB

- Free core → Paid managed hosting (Atlas)

Elastic

- Free core → Paid features + cloud hosting

GitLab

- Free → Paid DevOps & CI/CD features

Automattic

- Free software → Paid hosting & premium tools

And many more like **NocoDB, n8n, Plane, Appwrite etc...**

Great! We are done for now...
